## DETAILED ACTION

### *Election Acknowledgment*

1. Acknowledgment is made of the election of group I claims 1-7, without traverse, the non-elected claims 8-25 are withdrawn from the consideration. The non-elected claims should be canceled by the Application during the prosecution of this application.

### *Claim Rejections - 35 USC § 103*

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1- 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miller in view of Guse et al.

Regarding claims 1, 6-7, Miller discloses a Methods and system for detecting and determining the location of a chain jam with features of the claimed invention including actuators to apply plurality of loads to a moving chain, and deflecting it accordingly (see, figure 2), and indicator and sensor to measure various force effect (see, for example, claim 1). Miller does not explicitly recite the use for sensor to measure the chain travel. However, the use of such sensor in chain system detection is notoriously known in the art. For example, Guse et al., discloses a mining machine working chain teaching the use of proximity sensor to measure the chain travel (see, for example, figure 5). Therefore, it would have been obvious for a skilled

artisan at the time of the invention to modify Miller's device to provide for a chain travel sensing device in order to establish a more complete and hence more accurate tension measuring system.

Regarding claim 2, Miller shows the use of different value forces.

Regarding claim 3, the sensors transmit signals to the computing means.

Regarding claims 4-5, the rollers are considered to be contact pads.

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
